

Extra 5-3 Use Sales arrays

In this exercise, you will start with the declarations for five arrays that contain four elements each. Each array represents the sales for a region, and each element in an array represents the region's sales for one quarter. For instance, the second element (index 1) in the third array represents region 3's sales for the second quarter. Your job is to add event handlers that display the data in those arrays.

1. Open the HTML and JavaScript files in this folder:
`exercises_extra\ch05\sales_arrays\`
2. Look at the JavaScript code to see that it starts with the declarations for the five arrays that are described above.
3. Add an event handler for the click event of the Show Sales By Quarter button. This handler should display the results in the text area below the Results heading in this format:

```
Sales by Quarter
Q1: 9965
Q2: 7403
```

As you code this event handler and the other event handlers for this exercise, try to use for loops to do as much of the processing as possible.

4. Add an event handler for the click event of the Show Sales By Region button. This handler should display the results as shown above.
5. Add an event handler for the Show Total Sales button. This handler should display the total sales in a single line like this:

```
Total sales: 39907
```
